Data Layer Evolution Process

Database layer evolution process is very similar to human evolution process

Hibernate vs Spring Data JPA

Spring Data JPA

Spring Data JPA is an abstraction layer on top of JPA to Reduce the amount of boilerplate code required to implement data access object (DAO)

JPA

JPA is just a specification that facilitates object-relational mapping to manage relational data in Java applications

Hibernate

Hibernate is a JPA Implementation

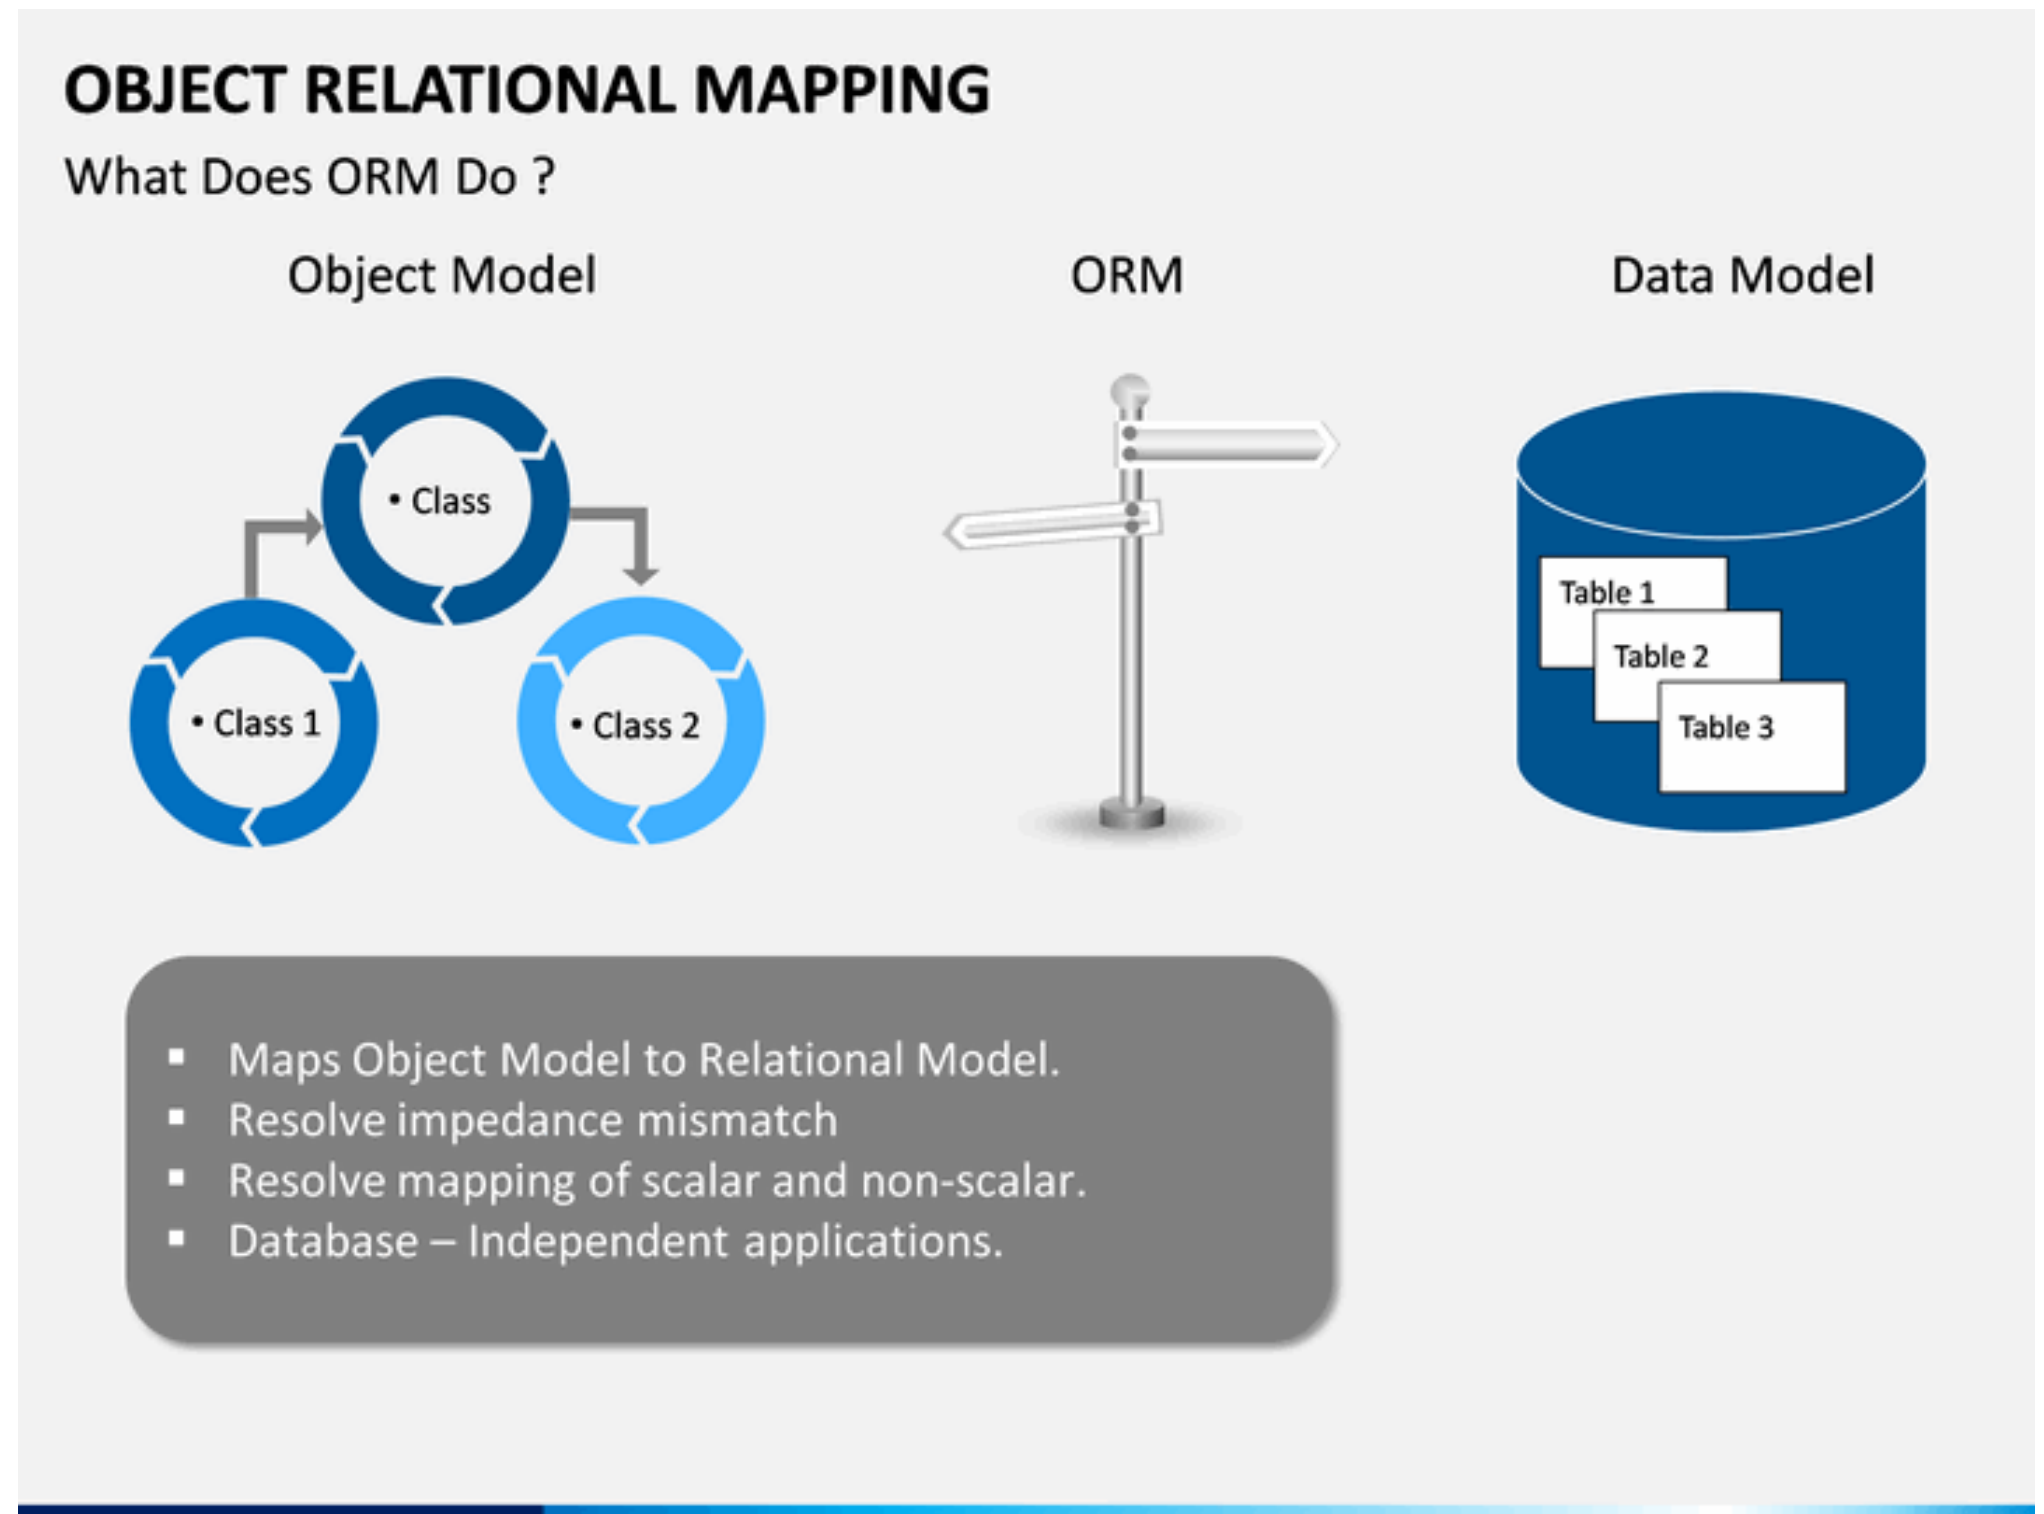

JDBC

Hibernate generates SQL query and executes using JDBC

What is Object Relational Mapping ORM?

Object Relational Mapping (ORM) is a technique used in creating a "bridge" between object-oriented programs and relational databases.

What is Hibernate Framework?

Hibernate ORM is an object–relational mapping tool for the Java programming language.

It provides a framework for mapping an object-oriented domain model to a relational database

What is JPA?

Jakarta Persistence API is a Jakarta EE (Earlier called J2EE) application programming interface specification that describes the management of relational data in enterprise Java applications

JPA
Java Persistence API

JSR

JPA vs Hibernate

The major difference between Hibernate and JPA is that Hibernate is a framework while JPA is API specifications

- **Hibernate is an implementation of JPA guidelines.**
- **It helps in mapping Java data types to SQL data types.**
- **It is the contributor of JPA.**

JPA vs Hibernate

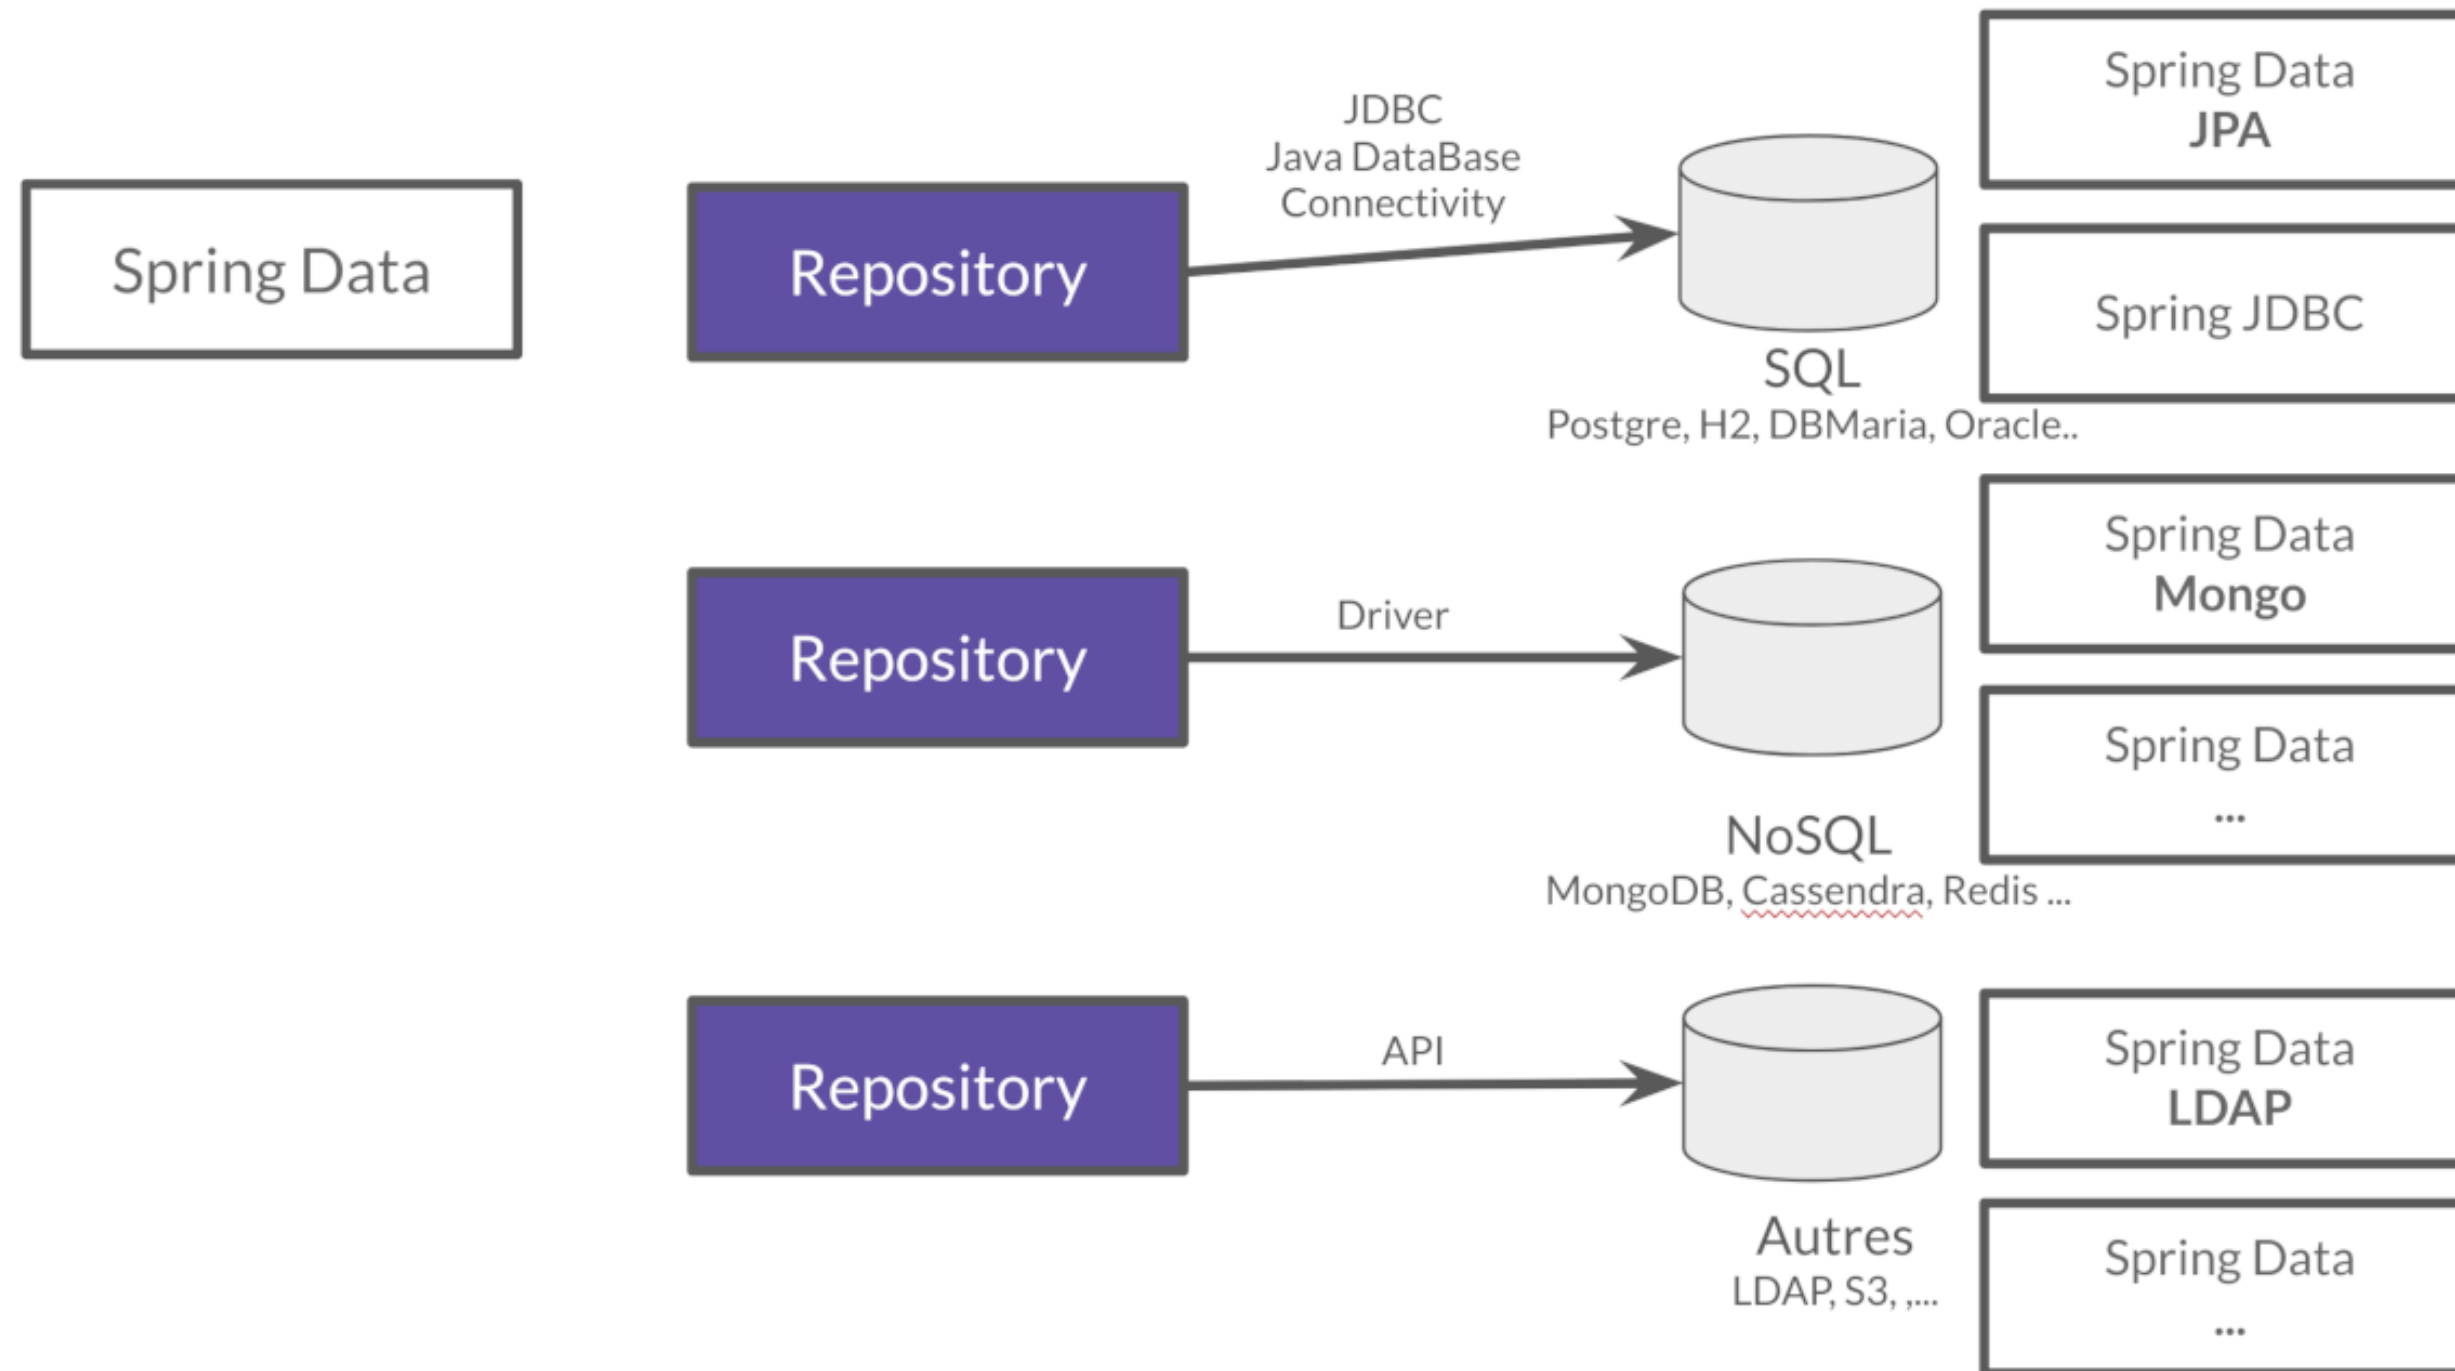

Advantage of JPA is that You can swap ORM in your project without changing the code

JPA vs Hibernate

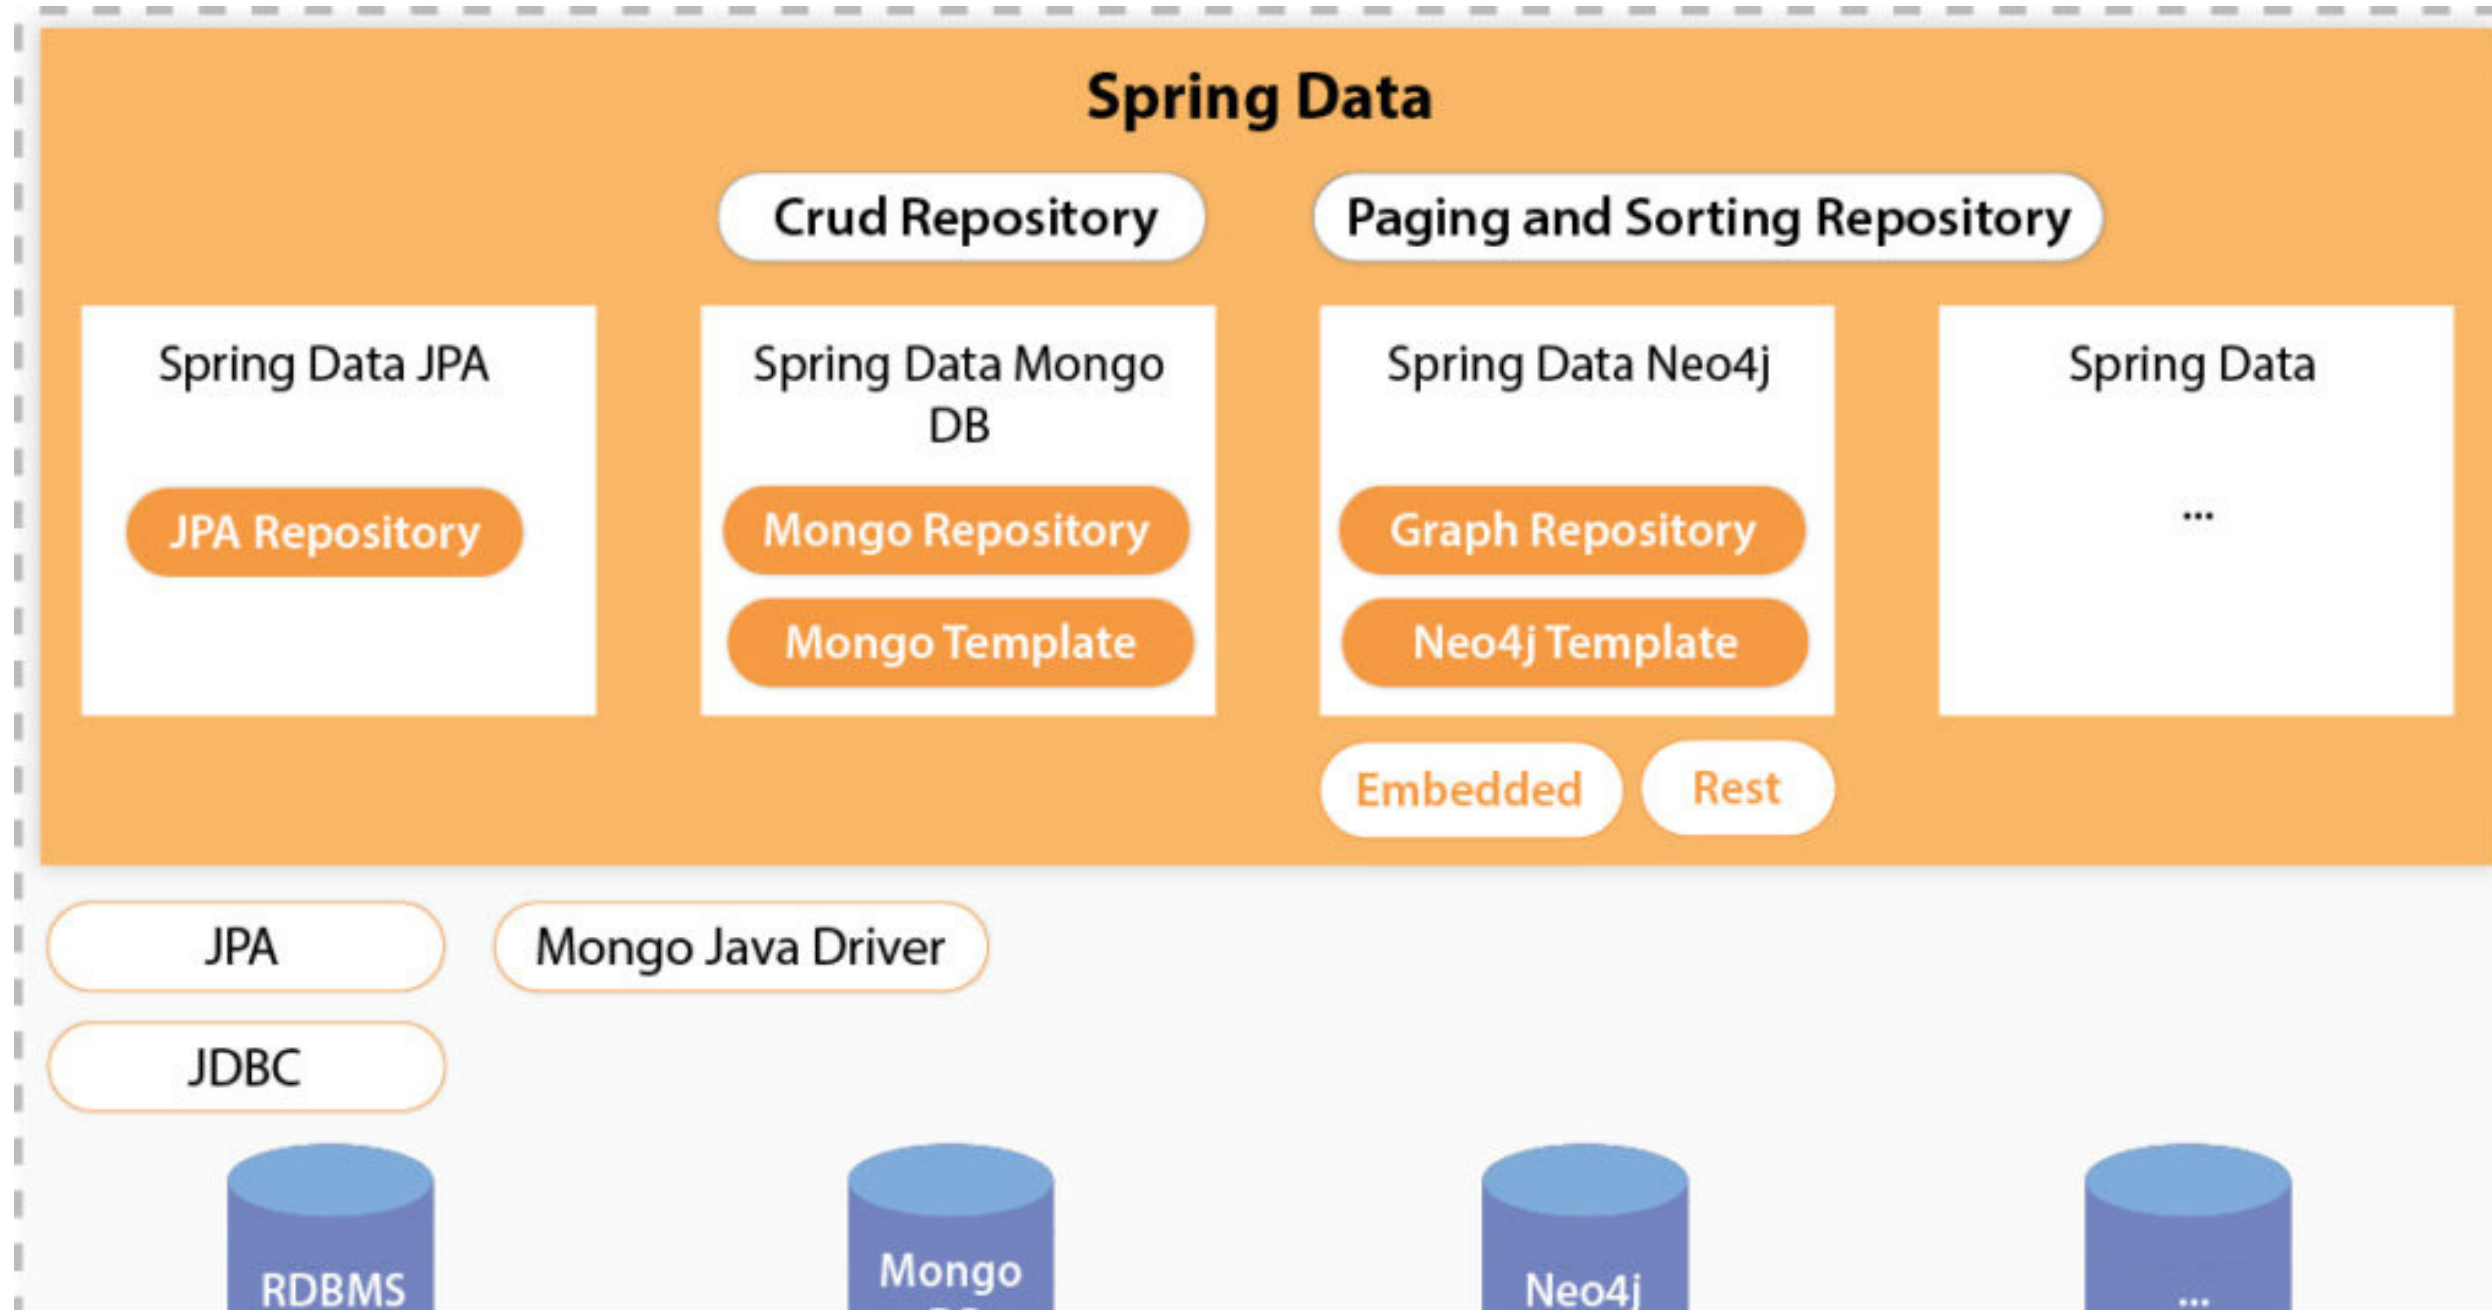

JPA	Hibernate
JPA is described in javax.persistence package.	Hibernate is described in org.hibernate package.
It describes the handling of relational data in Java applications.	Hibernate is an Object-Relational Mapping (ORM) tool that is used to save the Java objects in the relational database system.
It is not an implementation. It is only a Java specification.	Hibernate is an implementation of JPA. Hence, the common standard which is given by JPA is followed by Hibernate.
It is a standard API that permits to perform database operations.	It is used in mapping Java data types with SQL data types and database tables.
As an object-oriented query language, it uses Java Persistence Query Language (JPQL) to execute database operations.	As an object-oriented query language, it uses Hibernate Query Language (HQL) to execute database operations.
To interconnect with the entity manager factory for the persistence unit, it uses EntityManagerFactory interface. Thus, it gives an entity manager.	To create Session instances, it uses SessionFactory interface.
To make, read, and remove actions for instances of mapped entity classes, it uses EntityManager interface. This interface interconnects with the persistence condition.	To make, read, and remove actions for instances of mapped entity classes, it uses Session interface. It acts as a runtime interface between a Java application and Hibernate.

What is Spring Data?

The Spring-Data is an umbrella project having many sub-projects or modules to provide uniform abstractions and uniform utility methods for the Data Access Layer in an application and support a wide range of databases and datastores.

What is Spring Data?

By using Spring data We dont have to write Dao layer, we just need to declare Dao layer and it provide uniform interface to interact with polyglot of databases
